

#### What went well:

- Quality of life improvements such as better integration of social platform integration and overall layout
- Testing with real live user locations. We were able to see the correct number of users active within the user location radius
- Communication of commits to the repository/keeping repository clean and organized
- Meeting as a team for more useful/functional type meetings
- Feedback from third parties and our sponsor

#### What didn't go well:

- Small bugs that we did not have time to get to did not get fixed
- Figuring out optimal time to update user locations so the database doesn't get overworked but locations stay relevant to where the user is
- Getting a larger number of users active on the app for more realistic testing

#### What could be improved:

- User sign on process and email verification could be cleaner and smoother
- Overall smoothness of navigating through pages within the app

#### Challenges:

- Only being able to test with a very small number of users made it hard to see how flexibly our database is
- Keeping track of our meetings
